Sales Item Management - Technical Specification & Architecture Document

1. Executive Summary & Architecture Overview

1.1 Executive Brief

The Sales Item Management project is a front-end application governed by a strict technical constitution. It implements a decoupled architecture based on a mobile-first responsive design, utilizing a modular directory structure to separate structure, presentation, and behavior. The project focuses on W3C compliance, BEM naming conventions, and modern ES6+ asynchronous patterns to ensure maintainability and accessibility.

1.2 Maturity Assessment

The project specifications are structurally sound regarding coding standards but are currently in a state of REFINEMENT. While the core principles are well-defined, there is a high-severity gap concerning the Testing Discipline & Gates; the 'Validation' phase is mentioned as a workflow step but lacks concrete technical implementation details, such as CI/CD pipelines or specific test suites.

1.3 Technical Stack

- HTML
- CSS
- JavaScript ES6+

1.4 Architectural Constraints

- Strict separation of concerns: No inline styles or inline event handlers permitted.
- CSS naming convention: BEM.
- Layout strategy: Mobile-first approach using Flexbox and Grid.
- JS Pattern: Modular code with async/await and try/catch error handling.
- HTML Standard: W3C valid with mandatory alt attributes and form labels.
- Development Sequence: Planning (HTML) -> Styling (CSS) -> Behavior (JS) -> Validation.
- Governance: PR deviations require lead developer approval.

1.5 Critical Dependencies

- W3C Validation tools for HTML/CSS compliance.
- Browser compatibility matrix for JS validation.
- Lead developer approval gate for any constitutional deviations.

- Strict directory mapping: /index.html, /css/, /js/modules, /assets/.

2. Architecture Workflows

& Visual Diagrams

2.1 Technical Standards Traceability Map

Maps the relationship between governance rules, development sequences, and the specific coding standards they enforce.

2.2 Development Workflow Process

Detailed operational flow of the development sequence including validation gates and governance loops.

3. Detailed Technical Specifications & Business Rules

3.1 Requirements Traceability

Identifier	Type	Requirement Description	Source Section
HTML-SEMANTIC	coding_standard	HTML must be semantic, W3C valid, with mandatory alt attributes for images and labels for forms.	I. Semantic & Valid HTML
CSS-MODULAR	coding_standard	CSS must use a modular approach (BEM), CSS Variables for consistency, and prioritize Flexbox/Grid.	II. Modular & Maintainable CSS
JS-MODERN	coding_standard	JavaScript must use ES6+ syntax, be modular, and handle async operations via async/await with try/catch.	III. Clean & Modern JavaScript (ES6+)
SOC-STRICT	rule	Strict separation of HTML, CSS, and JS. No inline styles or inline event handlers permitted.	IV. Separation of Concerns
RESPONSIVE-FIRST	requirement	Application must be fully responsive using a mobile-first approach with media queries.	V. Responsive-First Design
DIR-STRUCTURE	tool_configuration	Directory structure: /index.html, /css/, /js/ (with /modules), and /assets/.	Project Structure
DEV-SEQUENCE	workflow_constraint	Development sequence: Planning (HTML) -> Styling (CSS) -> Behavior (JS) -> Validation.	Development Workflow
GOV-PR-APPROVAL	rule	Any deviation from the constitution must be justified in the PR and approved by the lead developer.	Governance

3.2 Security Rules

- No inline event handlers (e.g., `onClick`) are permitted to prevent XSS vulnerabilities and maintain SOC-STRICT.
- All JavaScript must be modular to avoid global scope pollution.

3.3 Data Models

- **Directory Model:**
 - `/index.html`: Entry point.

- /css/: Stylesheets (e.g., style.css, variables.css).
- /js/: Logic, including /modules for reusable components and main.js for orchestration.
- /assets/: Static assets (images, icons, fonts).

4. Project Governance & Structural Gaps

4.1 Structural Gaps

Gap	Priority	Remediation Advice
Testing Discipline & Gates	HIGH	The document mentions 'Validation' in the workflow but lacks specific testing gates (e.g., Unit tests, Integration tests, CI/CD pipeline requirements).
Open Questions & Uncertainties	LOW	No known uncertainties are listed; consider adding a section for future technical debt or architectural questions.

4.2 Remediation & Workflow

Deviations from the established constitution must be documented within the Pull Request (PR) and require explicit approval from the Lead Developer. Any amendments to the constitution itself require a version bump and a documented rationale.

5. Technical & Domain Glossary (Terminology Reference)

Term	Category	Context Anchor	Project Definition
BEM	TECHNICAL_STACK	CSS-MODULAR	A modular naming convention used to prevent specificity conflicts and improve maintainability of stylesheets.
Behavior	BUSINESS_DOMAIN	DEV-SEQUENCE	The third phase of the development sequence focusing on the implementation of functional logic.
CSS	TECHNICAL_STACK	CSS-MODULAR	The presentation layer governed by modularity, variables for consistency, and a mobile-first responsive strategy.

Term	Category	Context Anchor	Project Definition
HTML	TECHNICAL_STACK	HTML-SEMANTIC	The structural layer which must be semantic and compliant with W3C standards to ensure accessibility.
JS	TECHNICAL_STACK	JS-MODERN	The logic layer utilizing ES6+ syntax and asynchronous patterns to handle application functionality.
JavaScript	TECHNICAL_STACK	JS-MODERN	The logic layer utilizing ES6+ syntax and asynchronous patterns to handle application functionality.
PR	TECHNICAL_STACK	GOV-PR-APPROVAL	The formal mechanism where deviations from the constitution are justified and reviewed by the lead developer.
Planning	BUSINESS_DOMAIN	DEV-SEQUENCE	The initial phase of the development sequence dedicated to defining the structural markup.
SEO	TECHNICAL_STACK	HTML-SEMANTIC	The optimization goal achieved through the use of semantic tags and valid markup.
Styling	BUSINESS_DOMAIN	DEV-SEQUENCE	The second phase of the development sequence where visual requirements are applied to the structure.
Validation	BUSINESS_DOMAIN	DEV-SEQUENCE	The final phase of the development sequence involving official checkers and cross-browser testing.
