[PROJECT_NAME] - Technical Specification & Architecture Document

1. Executive Summary & Architecture Overview

1.1 Executive Brief

This project is currently a skeletal architectural template for a project constitution. It defines a structural framework for governance, coding standards, and testing gates but contains no concrete technical implementation, host platform, or data patterns. It serves as a blueprint for establishing a 'Library-First' and 'Test-First' development culture.

1.2 Maturity Assessment

The project is in a pre-initialization state. While the structural mapping is complete, the content consists entirely of placeholders and examples. Due to the high-severity gap regarding the total absence of project-specific decisions and the lack of a defined uncertainty log, the status is **REFINEMENT**.

1.3 Technical Stack

- **Languages & Frameworks:** None defined (Template state)
- **Databases:** None defined
- **SDKs/Tools:** None defined

1.4 Architectural Constraints

- **TDD Mandatory:** Red-Green-Refactor cycle strictly enforced.
- **Library-First:** Features must be standalone, self-contained, and independently testable.
- **CLI Interface:** Text in/out protocol (stdin/args to stdout, errors to stderr).
- **Output Formats:** Support for both JSON and human-readable formats.
- **Integration Testing:** Mandatory for new library contracts, contract changes, and inter-service communication.

1.5 Critical Dependencies

- **Governance Authority:** Governance rules (GOV-01) serve as the primary authority over all technical principles.
- **Testing Gate:** Strict dependency between feature implementation and prior test approval (Test-First gate).
- **Contract Integrity:** Referential integrity between library contracts and integration test suites.

2. Architecture Workflows

& Visual Diagrams

2.1 Project Constitution Traceability Map

Visualizes the governance structure and the relationship between the overarching governance rules and the core project principles.

2.2 Governance Compliance Workflow

Models the conceptual process of verifying a project change against the Constitution principles, including a decision gate for compliance.

3. Detailed Technical Specifications & Business Rules

3.1 Requirements Traceability

Identifier	Requirement / Rule Description	Source Section	Type
PRINCIPLE-1	[PRINCIPLE1DESCRIPTION] (Placeholder for Core Principle 1)	[PRINCIPLE1NAME]	Requirement
PRINCIPLE-2	[PRINCIPLE2DESCRIPTION] (Placeholder for Core Principle 2)	[PRINCIPLE2NAME]	Requirement
PRINCIPLE-3	[PRINCIPLE3DESCRIPTION] (Placeholder for Test-First approach)	[PRINCIPLE3NAME]	Testing Gate
PRINCIPLE-4	[PRINCIPLE4DESCRIPTION] (Placeholder for Integration Testing)	[PRINCIPLE4NAME]	Testing Gate
PRINCIPLE-5	[PRINCIPLE5DESCRIPTION] (Placeholder for Observability/Versioning/Simplicity)	[PRINCIPLE5NAME]	Requirement
GOV-01	[GOVERNANCE_RULES] (Placeholder for governance and amendment rules)	Governance	Rule

3.2 Security Rules

No specific security rules defined in the current template.

3.3 Data Models

No data models defined in the current template.

4. Project Governance & Structural Gaps

4.1 Structural Gaps

Missing Section	Priority	Remediation Advice
Open Questions & Uncertainties	HIGH	The document is a template and contains no actual project-specific decisions or open questions. A dedicated section for uncertainties must be created.

4.2 Remediation & Workflow

The project must transition from a template to a populated constitution by replacing all [PLACEHOLDERS] with concrete technical decisions and establishing a formal uncertainty log to track architectural pivots.

5. Technical & Domain Glossary (Terminology Reference)

Term	Category	Context Anchor	Project Definition
BUILD	TECHNICAL_STACK	PRINCIPLE-5	The third segment of the semantic versioning triplet used to track incremental compilation iterations.
JSON	TECHNICAL_STACK	PRINCIPLE-2	The structured data interchange format required for machine-readable output in command-line interfaces.
MAJOR	TECHNICAL_STACK	PRINCIPLE-5	The primary versioning digit indicating incompatible API changes.
MINOR	TECHNICAL_STACK	PRINCIPLE-5	The secondary versioning digit indicating backward-compatible functionality additions.
NON	BUSINESS_DOMAIN	PRINCIPLE-3	A strict modifier indicating that a specific requirement is mandatory and cannot be bypassed.
Principle	BUSINESS_DOMAIN	Core Principles	A fundamental governing rule that dictates the architectural and coding direction of the system.
TDD	TECHNICAL_STACK	PRINCIPLE-3	A development cycle where verification scripts are authored before the actual logic implementation.
YAGNI	TECHNICAL_STACK	PRINCIPLE-5	An architectural constraint forbidding the implementation of features until they are actually required.
